RAGE

Service and Operation Manual

2604 Liberator Dr., Prescott, AZ 86301 1-928-445-3030

Congratulations on your purchase of the **RAGE**[®] Truck mount cleaning unit. This instruction/parts manual is a guide for operating and servicing your **SAPPHIRE SCIENTIFIC** Truck mount unit.

Proper operation and service are necessary to ensure the outstanding performance of this unit. When properly maintained, your Truck mount will have a long and trouble-free life.

The following service methods outlined in this manual are detailed in a manner that operation and servicing may be performed properly and safely. Because service levels vary due to the skill of the mechanic, tools and parts availability, ensure that prior to attempting any repair, you are familiar with this equipment and have the proper tools. Any questions regarding the operation, service, or repair of this unit should be directed to your nearest **SAPPHIRE SCIENTIFIC** dealer.

The headings **WARNING** and **CAUTION** are utilized to warn you that steps must be taken to prevent personal injury or damage to the equipment. Please make sure that you have read and understand these instructions entirely before proceeding with the operation of this unit.

THIS UNIT MUST BE INSTALLED BY THE DEALER THAT YOU PURCHASED IT FROM IN ACCORDANCE WITH THE SAPPHIRE SCIENTIFIC INSTALLATION PROCEDURES.

BE SURE TO FILL OUT THE WARRANTY CARD ONLINE AT WWW.SAPPHIRE SCIENTIFIC.COM

Record your units serial number here for future reference or if you should need to contact the factory in the future for any reason.

RAGE[®] MANUAL PART# 49-057

SAPPHIRE SCIENTIFIC LIMITED WARRANTY

Sapphire Scientific RAGE®

What Does This Warranty Cover?

This warranty covers the Sapphire Scientific RAGE[®] and is provided to the original purchaser only.

How Long Does This Warranty Last?

This warranty runs for:

• Two (2) years from the date of installation on parts and labor (Excluding normal maintenance items.) Factory installed original belts are covered for 1000 hours or 2 years, whichever comes first. Water box, recovery tank and frame are covered for five years. All other components including seals, o-rings and electrical components are covered for the entire two year warranty period.

What Sapphire Scientific Will Do:

If a defect in materials or workmanship occurs within the warranty period, Sapphire Scientific at its election will repair or replace the defective part at no charge.

What This Warranty Does Not Cover:

This warranty does not cover or apply to defects due directly or indirectly to misuse, abuse, disassembly, alteration, corrosive chemicals, improper voltage, improper fuel, fire, flood, negligence, accident, improperly or incorrectly performed maintenance or repair, or failure to perform necessary or recommended maintenance or repair (See your Owner's Manual) or if the use of this product is not in compliance with the instructions and specifications for its use. This warranty does not cover normal maintenance items such as air and oil filters, lubricants and tune up parts. Paint is not covered. Water box, recovery tank and frame are covered for five years. All other components including seals, o-rings and electrical components are covered for the entire two year warranty period. We limit all implied warranties to:

• Two (2) years from the installation date on parts and labor. It is strongly recommended that this truck mount be used with, and only with, Sapphire Scientific Chemicals and as directed by label instructions on chemical bottles.

OTHER THAN THE WARRANTIES PROVIDED HEREIN, SAPPHIRE SCIENTIFIC MAKES NO EXPRESS OR IMPLIED, ORAL OR WRITTEN WARRANTIES WITH RESPECT TO THIS PRODUCT OR WORKMANSHIP AND ALL WARRANTIES IMPLIED BY LAW INCLUDING ANY WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE ARE LIMITED TO THE DURATION OF THIS WARRANTY. Some states do not allow limitations on how long an implied warranty lasts, so the above limitations may not apply to you. WE SHALL IN NO EVENT BE LIABLE FOR DEATH, INJURIES TO PERSONS OR PROPERTY OR FOR INCIDENTAL, CONTINGENT, SPECIAL OR CONSEQUENTIAL DAMAGES ARISING FROM USE OF OUR PRODUCTS. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

How Do I Get Service?

In order to be eligible for service under this warranty you MUST do the following: (a) fill out the warranty registration card on-line within thirty (30) days of the installation of our product; (b) have your dealer write or call for a return material authorization (RMA); and (c) have the serial number and original proof of installation date available. Proof of proper maintenance may be required before warranty is granted.

Contact us at:

Sapphire Scientific 2604 Liberator, Prescott, AZ 86301 Phone: 928-445-3030

If our dealer uncovers a defect we will repair or replace the product, at our election. Ground shipping and transportation costs will be covered by the manufacturer. Returning defective parts to the manufacturer, if required, shall be the responsibility of the purchaser. Warranty may be denied if defective parts are not returned within the allotted 30 days. If it is determined that there is no defect in the product, or that the defect resulted from causes not within the scope of our warranty, then the product will be repaired or replaced only at your request and at your expense and you must bear all shipping costs.

1. SAFETY

⚠ WARNING For Your Safety!

The following WARNING labels are on your **RAGE**[®] console. These labels point out important Warnings and Cautions, which must be followed at all times. Failure to follow warnings could result in personal

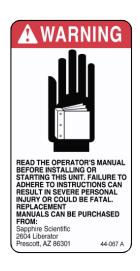

injury or fatality to yourself and/or others or property damage. Please follow these instructions carefully! **DO NOT remove** these decals.

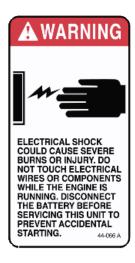

WARNING:

OPERATE THIS UNIT AND EQUIPMENT ONLY IN A WELL-VENTILATED AREA. EXHAUST FUMES CONTAIN CARBON MONOXIDE WHICH IS AN ODORLESS AND DEADLY POISON THAT CAN CAUSE SEVERE INJURY OR FATALITY. DO NOT RUN THIS UNIT IN AN ENCLOSED AREA. DO NOT OPERATE THIS UNIT WHERE THE EXHAUST MAY ENTER ANY BUILDING DOORWAY, WINDOW, VENT, OR OPENING OF ANY TYPE.

DO NOT RUN ENGINE WITH COVER OFF VOIDS WARRANTY

1. Read the operator's manual before starting this unit.

Failure to adhere to instructions could result in severe personal injury or could be fatal.

2. Operate this unit and equipment only in a well-ventilated area.

Exhaust fumes contain carbon monoxide, which is an odorless and deadly poison that can cause severe injury or death. **DO NOT** run this unit in an enclosed area. **DO NOT** operate this unit where the exhaust may enter a building doorway, window, vent or other opening.

3. Gasoline is extremely flammable and its vapors can explode if ignited.

Store gasoline only in approved containers, in well-ventilated, unoccupied buildings and away from sparks or flames. Never carry gasoline or any flammable materials in the vehicle. Fumes could accumulate inside of the vehicle and ignite, causing an explosion.

- 4. This unit must be operated with the vehicle doors open in order to ensure adequate ventilation to the engine.
- 5. **DO NOT** operate unit if gasoline is spilled. Do not turn ignition switch until the gasoline has been cleaned up. Never use gasoline for cleaning purposes.
- 6. **DO NOT** place hands, feet, hair, clothing or any body parts near rotating or moving parts. Rotating machinery can cause severe injury or death.
- 7. **NEVER** operate this unit without belt and safety guards. High speed moving parts, such as belts and pulleys, should be avoided while the unit is running. Severe injury, fatality or damage may result.

- 8. **NEVER** service this unit while it is running. High speed mechanical parts as well as high temperature components may result in injury or severed limbs.
- 9. Engine components will be extremely hot from operation. To prevent severe burns, **DO NOT** touch these areas while the unit is running or shortly after the unit is shut off.
- 10. **DO NOT** touch any part of the exhaust system while the system is running or for 20 minutes after the unit is shut off. Severe burns could result.
- 11. Water under high pressure at high temperature can cause burns, severe personal injury, or fatality. Shut down unit, allow it to cool down and relieve the system of all pressure before removing caps, valves, plugs, fittings, filters or hardware.
- 12. **NEVER** leave the vehicle engine running while the unit is in operation.
- 13. **Battery acid contains sulfuric acid**. To prevent acid burns, avoid contact with skin, eyes and clothing. Batteries also produce explosive hydrogen gases while charging. To prevent fire or explosion, charge batteries only in a well ventilated area. Keep sparks, open flames, as well as other sources of ignition away from battery at all times. Remove all jewelry prior to servicing batteries. Keep batteries out of the reach of children.

Before disconnecting the negative (–) ground cable, ensure that all switches are in the off position. If on, a spark could occur at the ground connection terminal which could cause an explosion if hydrogen gas or gasoline vapors are present. ALWAYS disconnect the negative (–) terminal first.

14. **DO NOT** smoke around the machine. Gas fumes could accumulate and ignite. Battery gases are extremely flammable. This will prevent possible explosions.

- 15. **DO NOT** damage the vehicle in any way during the installation. When routing fuel lines **DO NOT** configure the hose in any locations where the hose or vehicle could be damaged. Avoid contact with moving parts, hot surfaces, brake lines, fuel lines, catalytic converters, exhaust pipes, mufflers or sharp objects.
- 16. **NEVER** cut or splice any of the vehicle fuel lines during fuel line installation. This will result in fuel leaks and potentially dangerous conditions. Use only the provided fuel hose for fuel lines. When going through the vehicle floor with fuel lines, always utilize bulkhead adaptors. This will prevent fuel leaks and ensure that hoses are not punctured by vehicle vibration abrasion.
- 17. **DO NOT** exceed your vehicles weight limit. The console with waste tank and accessories weighs approximately 858 pounds. Make certain that the vehicle has the correct axle rating. This will prevent unsafe or hazardous driving conditions.
- 18. High back seats are required for all vehicles that units are to be installed for head and neck protection. Metal partitions between the seats and equipment are strongly recommended.
- 19. **DO NOT** operate this unit without the water supply on and attached. The water pump and other vital components could be seriously damaged if the unit is operated dry.
- 20. Always keep your vehicle clean and orderly. Wands, tools and accessories must be securely stowed while driving the vehicle.
- 21. All high-pressure hoses must be rated at 3000 PSI and have a heat rating of 250 degrees F. Thermoplastic hoses do not meet this criteria and should never be used. Severe burns and other injuries could result if hoses do not meet these requirements.

- 22. Ensure that you have received proper training from the distributor that you purchased the unit from prior to operation.
- 23. This unit produces high pressure and high temperatures. Improper use could result in serious injury.
- 24. **DO NOT** modify this unit in any manner. Any modification could result in serious injury or fatality.
- 25. California Proposition 65 Warning: Engine exhaust from this product contains chemicals known by the State of California to cause cancer, birth defects, or other reproductive harm.

<u>SPECIFICATIONS</u>	
Engine Speed 3000 rp	om (High Speed No Load)
1500 rpm (Idle No Load)	
Water Pump RPM	1450 rpm
Vacuum Pump RPM	3200 rpm
Water Flow Rate	3.0GPM (maximum)
Water Pump Pressure	1000 PSI (maximum)
Vacuum Relief Valve	12 in II.
Waste Tank Capacity	
Console Weight	520 lbs.
Console Weight (w/standard waste tank & hoses)	858 lbs.
Operating Weight (w/full water box & standard waste tank)	1534 lbs.

TORQUE VALUES

Engine Hub Front		13.3 ft/lbs.
Vacuum Pump Hub	160 inch/lbs.	13.3 ft/lbs.
Pressure Pump Hub	130 inch/lbs.	10.8 ft/lbs.
-		

JET SIZING
SAPPHIRE SCIENTIFIC recommends that the total floor tool tip size does not exceed #4. Using larger jet sizes on your RAGE® unit may reduce cleaning temperatures.

INSTALLATION REQUIREMENTS

Prior to beginning the installation, read the ENTIRE "Installation" section of this manual. Since the **RAGE**® Truck mount unit weighs (with standard waste tank and hoses) approximately 858 lbs., please adhere to the following recommendations prior to installing the unit.

CAUTION!

The console and waste tank with accessories must NOT exceed the vehicle's axle weight limit.

- 1. If mounting the unit in a trailer, ensure that the trailer is rated for the total weight of the **unit and trailer.** Electric or hydraulic brakes must be provided, and strict compliance with all State and Federal laws must be maintained.
- 2. If mounting in a trailer, the **RAGE**® console must be positioned so that it balances properly with respect to the trailer axle. Ten percent (10%) of the unit's total overall weight (w/o accessories or water) should be on the tongue. This unit has an air cooled engine, and adequate ventilation must be provided to prevent overheating.
- 3. If mounting in a trailer, the external fuel tank must meet EPA requirements for compliance.
- 3. The vehicle tires must have a load rating in excess of the combined unit and vehicle weight.
- 4. **SAPPHIRE SCIENTIFIC** does not recommend using any type of flooring materials that absorb water. This condition will result in rust and corrosion of the vehicle floor.
- 5. Insulation under rubber mats should be removed prior to installation of the unit.

FUEL REQUIREMENTS

Use unleaded fuel ONLY. Use only fresh, clean unleaded gasoline with a minimum octane rating of 87. **Do Not** use high octane gasoline. Gasoline with up to, not exceeding, 10% ethanol is acceptable.

NOTE: Using other gasoline/alcohol blends including E20 and E85 will cause damage to engine components and will void warranty.

ENGINE OIL REQUIREMENTS

Use high-quality oil of at least API (American Petroleum Institute) service class SG, SH, SJ or higher. **Do not use additives.** High quality 30W oil is recommended. A 10-30 synthetic blend may be used after 50 hours of operation for a new or rebuilt engine to allow the piston rings to properly seat. It is never recommended to extend oil change intervals past 100 hours.

Engine oil capacity	1.7 L 1.8 U.S.qts
---------------------	----------------------

Tightening torque	Drain Plug	13.6 N·m 1.4 kgf·m 10.0 lbf·ft
-------------------	------------	--------------------------------------

NOTE: Using lower service class oil or extending oil change intervals longer than recommended can cause engine damage.

NOTE: Synthetic oils meeting the listed classifications may be used with oil changes performed at recommended intervals. However to allow piston rings to properly seat, a new or rebuilt engine should be operated for at least 50 hours using standard petroleum based oil before switching to synthetic oil.

CHEMICAL REQUIREMENTS

The **SAPPHIRE SCIENTIFIC RAGE**[®] Truck mount unit's unique last step chemical injection system can be used with a wide variety of water diluted chemical compounds, either acidic or alkaline, depending on the work to be performed. We recommend using only **SAPPHIRE SCIENTIFIC** and **CHEMSPEC** brand chemistry.

WATER REQUIREMENTS

Because hard water deposits will damage the plumbing and heat exchange systems on this unit, **SAPPHIRE SCIENTIFIC** recommends that a high quality water softener be used in areas where the water hardness exceeds 3½ grains. If a water softener is used, it must have a flow capacity of at least five (5) GPM or greater, without any hose constrictions.

The use of a water softening system will reduce maintenance and reduce down time caused by hard water scaling. It will also enhance the performance of cleaning chemicals, which will result in greater efficiency in lower concentration.

2. RECEIVING YOUR TRUCKMOUNT UNIT

DEALER RESPONSIBILITY

THE SAPPHIRE SCIENTIFIC DEALER THAT YOU PURCHASED THIS TRUCKMOUNT CLEANING UNIT FROM IS RESPONSIBLE FOR THE PROPER INSTALLATION OF THIS MACHINE. THE DEALER IS ALSO RESPONSIBLE FOR THE PROPER INITIAL TRAINING OF YOUR OPERATORS AND MAINTENANCE PERSONNEL.

ACCEPTANCE OF SHIPMENT

Your **RAGE**[®] Truck mount cleaning unit was thoroughly tested, checked and inspected in its entirety prior to leaving our manufacturing facility. When receiving your unit, please make the following acceptance check:

- 1. The unit should not show any signs of damage. If there is damage, notify the common carrier immediately.
- 2. Carefully check your equipment and packing list. The standard **SAPPHIRE SCIENTIFIC RAGE**[®] unit should arrive with the following items as well as any optional accessories:

EQUIPMENT LISTING

- A. SAPPHIRE SCIENTIFIC RAGE MODEL console.
- Operation and Service manual.
- Installation mounting plates and bolt down kit.
- Hose clamps for vacuum and fuel hoses.
- Waste tank with shutoff switch.
- Waste tank filter and stainless steel strainer basket.
- 50 ft. of ¼ in. high pressure solution hose with shutoff valve and quick connects.

• 50 ft. of ¼ in. high pressure solution hose with quick connects

- 2 50 ft. lengths of 2 in vacuum hose.
- 1 hose coupler 2 inch.
- 50 ft. water supply hose with quick connect.

OPTIONAL EQUIPMENT

- A. Additional 50 ft.2 in. vacuum hose
 - Part # 18-003
- Additional vacuum hose connectors
 - Part # 21-003
- Additional high-pressure solution hoses
 - Part # 18-000
 - With shutoff valve Part # 18-001
- Demand pump system
 - Part # 68-002
- Automatic Waste Pump-Out Kit
 - Part #68-158

FUEL HOOK-UP KITS BY VEHICLE

•	Chevy 1997 to 2002 FI	69-003FI
•	Chevy 2003 FI	69-018FI

SECTION 2: INSTALLATION

3 INSTALLATION

Lifting the unit into the vehicle	1(
Positioning the unit into the vehicle	
Fastening down the unit and waste tank	
Dimensional diagrams	
Installation of fuel lines	
Trailer fuel tank and fuel line installation	
Battery Connection	
Fire extinguisher	
Console to waste tank connection	13

3. INSTALLATION

△ WARNING!!!

This unit must be bolted to the floor of the vehicle by an authorized SAPPHIRE SCIENTIFIC DISTRIBUTOR.

LIFTING THE UNIT INTO THE VEHICLE

Because the **SAPPHIRE SCIENTIFIC RAGE**® weighs approximately 520 lbs., a forklift is necessary to place the unit into the vehicle. Place the forks under the unit. Using two "C" clamps, secure the console to the forks. Move the unit into desired position.

POSITIONING THE UNIT INTO THE VEHICLE

Vehicles vary in size and openings. Owners have different preferences on where in the vehicle they want their units positioned. **SAPPHIRE SCIENTIFIC** strongly recommends a side door installation for the **RAGE**[®]. We **DO NOT** recommend a rear door installation.

- 1. Ensure that enough space is provided to assure adequate engine ventilation as well as room for service and maintenance.
- 2. Operating weight of the complete installation (which includes water weight) with waste tank and all accessories **MUST NOT** exceed the vehicle's axle weight limit. Please refer to **SPECIFICATIONS** in Section 1 for standard unit and waste tank operating weight.

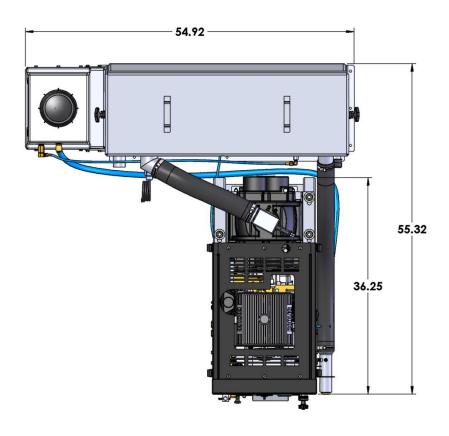

FASTENING DOWN THE UNIT AND WASTE TANK

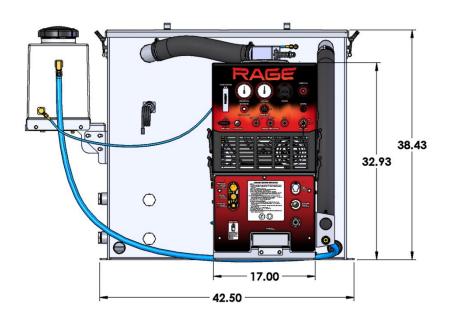

Prior to drilling any holes in the vehicle floor, ensure that while drilling, you will not damage the fuel tank, fuel lines, or any other vital components which could affect the safety or operation of the vehicle.

- A. The console and waste tank mounting holes will serve as a template. Drill six (6) $^{13}/_{32}$ in. diameter holes for the console and four (4) $^{13}/_{32}$ in. diameter holes for the waste tank.
- B. Using the provided mounting hardware kit:
 - 1. Insert six (6) 3/8-16 × 4 in. grade 5 hex head cap screws with flat washers through the **RAGE**® console mounting holes, and four (4) 3/8-16 × 4 in. grade 5 hex head cap screws with flat washers through the waste tank mounting holes.
 - 2. Install the provided mounting plates underneath the vehicle floor.
 - 3. Screw the provided $\frac{3}{8}$ -16 hex head lock nuts on to the mounting bolts and tighten until the console and waste tank are firmly attached to the vehicle floor.

SECTION 2 DIMENSIONAL DIAGRAM REAR MOUNT TANK

INSTALLATION OF FUEL LINES

READ THESE INSTRUCTIONS IN THEIR ENTIRETY PRIOR TO PROCEEDING.

The Vehicle fuel lines should NOT be spliced under ANY circumstances. Severe injury or fatality could result.

DO NOT damage the vehicle in any way during the installation. When routing fuel lines **DO NOT** configure the hoses in any location where the hoses or vehicle could be damaged. Avoid contact with moving parts, areas of high temperature, brake lines, fuel lines, catalytic converters, exhaust pipes, mufflers or sharp objects.

TRAILER FUEL TANK AND FUEL LINE INSTALLATION

The following are recommendations for trailer installations:

A. Strict compliance with all federal and state laws must be maintained.

B. Use only fuel tanks that are manufactured specifically for gasoline, that are EPA compliant with proper vented filling caps, and outlet connections that are the same size as the inlet and return connections on the unit.

C. **DO NOT** install fuel tanks inside any type of enclosed trailer or vehicle.

NEVER carry gasoline or flammable materials in an enclosed trailer or vehicle.

NEVER store any type of flammable material in an enclosed trailer or vehicle.

D. Always mount fuel tanks where they will be protected from any vehicle collision.

E. When installing fuel lines from the fuel tank to the unit, use the proper size fuel line.

BATTERY CONNECTION

△ WARNING!

Explosive gases, Dangerous gases!

Batteries contain sulfuric acid. To prevent acid burns, avoid contact with skin, eyes and clothing. Batteries also produce explosive hydrogen gases while charging. To prevent fire or explosion, charge batteries only in a well ventilated area. Keep sparks, open flames, as well as any other sources of ignition away from batteries at all times. Remove all jewelry prior to servicing batteries. Keep batteries out of the reach of children

Before disconnecting the negative (-) ground cable, ensure that all switches are in the OFF position. If ON, a spark could occur at the ground connection terminal, which could cause an explosion if hydrogen gas or gasoline vapors are present. ALWAYS disconnect the negative (-) terminal first.

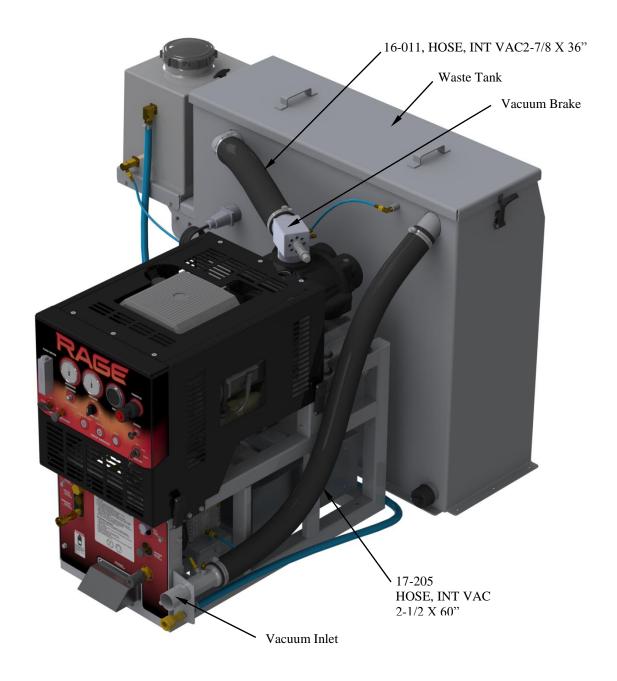

A. Attach the red positive (+) battery cable from the starter solenoid on the console to the positive (+) terminal on the battery and tighten down the nut.

B. Attach the black negative (–) battery cable from the ground on the console to the negative (–) terminal on the battery and tighten down the nut.

FIRE EXTINGUISHER

SAPPHIRE SCIENTIFIC, and many government agencies, recommend that a fire extinguisher rated for A, B, and C type fires be installed into any commercial vehicle.

Freeze protection	22

4. SYSTEMS

NOTE: Read and understand this section of the manual entirely before proceeding.

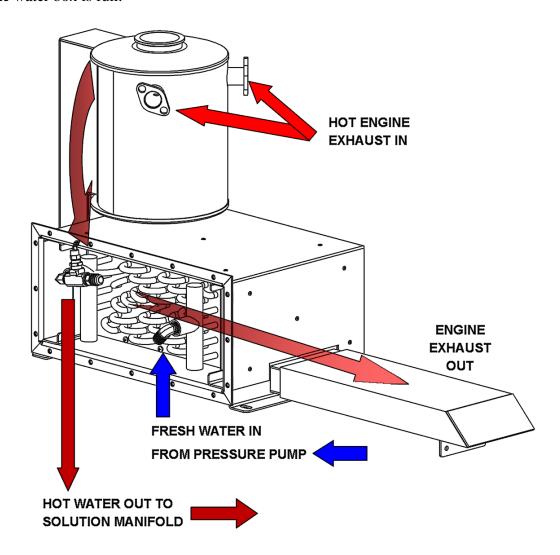

This portion of the manual divides the unit up into systems and describes how each system works. Prior to proceeding into the operations and maintenance sections of this manual it is recommended that you acquire a basic understanding of how the unit functions.

WATER/HEATING SYSTEM

Cold water enters the water box and flows through a float valve, which shuts off the water when the water box is full. The water then flows to the water pump where it is pressurized. From there it flows to the heat exchanger where it travels through tubing and is heated by the vacuum blower and engine exhaust.

The hot water then flows through the check valve manifold that contains a strainer and a check valve. At this point, the chemical injection takes place.

The hot solution mixture of water and chemicals then flows through the solution outlet manifold to the cleaning tool.

Water Inlet

VACUUM SYSTEM

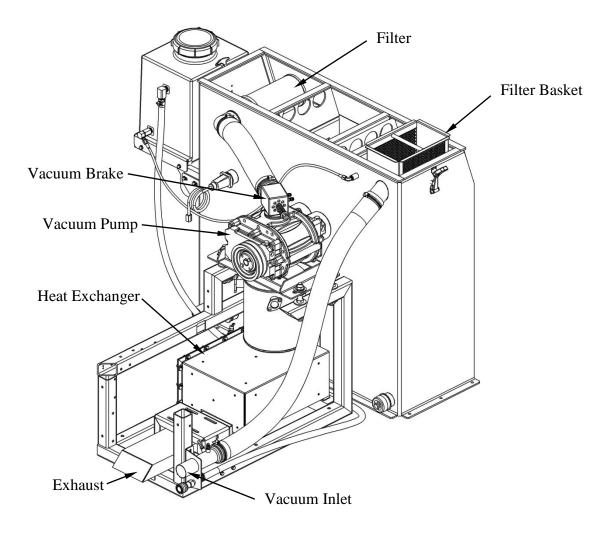

The engine turning an air pump (vacuum pump) generates vacuum. The air is channeled in one side of the vacuum pump, compressed and discharged on the opposite side, creating airflow. This airflow is used to do the work necessary for the extraction process. A vacuum nozzle applied to the carpet surface removes moisture, dirt and spent chemicals. These elements are conveyed back to a separating tank utilizing hoses and the force of air. Particles of moisture and dirt are separated in the vacuum tank using a series of changes in direction and velocity. The air is then filtered and rushes into the vacuum pump.

The vacuum pump also heats incoming air as it is compressed. The hot discharged air is forced down

stream into a silencer for noise abatement. Exiting the silencer, this hot air is directed through the heat exchanger

The vacuum pump speed is factory set to maximize vacuum and provide sustained system life. Do not alter the vacuum speed outside the recommended range shown in the Technical Specifications section.

A level shut off sensor is located near the top of the waste tank and will shut down the unit before the tank is at full capacity. This protects the vacuum pump from water damage. **Note:** Waste tank level shut off will not shut the unit off due to high levels of foam. The use of a quality defoamer is recommended.

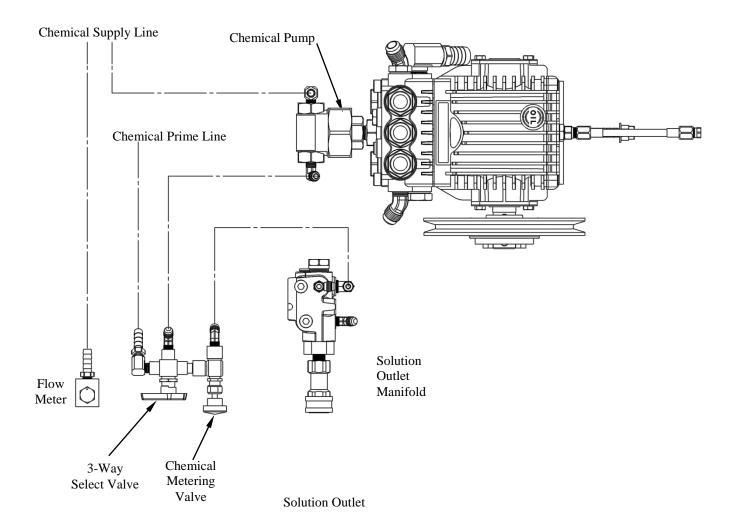

CHEMICAL PUMPING SYSTEM

The chemicals are drawn from the chemical container through a strainer into the flow meter mounted on the control panel. The flow meter indicates the rate of chemical flow.

The chemical then flows through the stainless steel chemical pump, the chemical is then injected into a three way selector valve located on the front panel. This valve may be used to turn the chemical flow **ON**, **OFF**, or to **PRIME** the chemical pump.

The chemicals then flow through the chemical metering valve to the solution outlet. This valve controls the rate of flow of chemical into the cleaning solution, which is indicated on the flow meter.

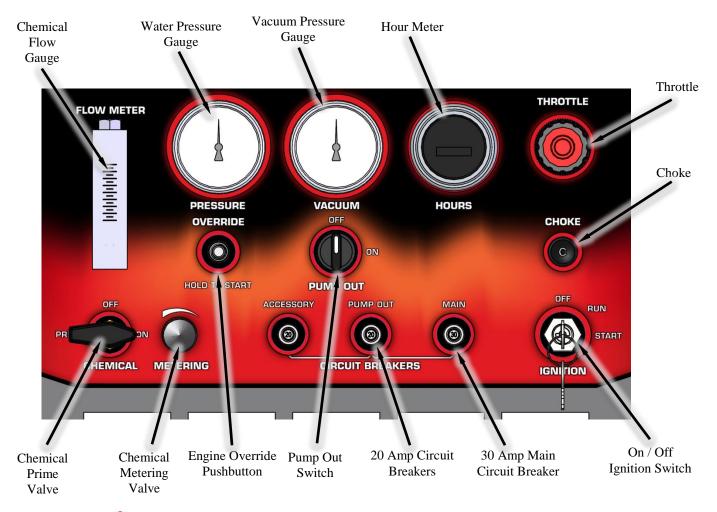

5. OPERATION

PREPARATION

This section of the operator's manual explains how to prepare, start, operate, shut down and maintain your **SAPPHIRE SCIENTIFIC RAGE**[®] mobile cleaning unit. The **RAGE**[®] unit is easy to operate, however only trained operators should proceed.

Operate this unit and equipment only in a well-ventilated area. Exhaust fumes contain carbon monoxide, which is an odorless and deadly poison that can cause severe injury or death. DO NOT run this unit in an enclosed area. DO NOT operate this unit where the exhaust may enter a building doorway, window, vent or any other opening.

⚠ ATTENTION- VACUUM PRESSURE GAUGE ACCURACY

After shipment, pointer may not rest at zero due to internal case pressure buildup caused by temperature variations. Accuracy may be significantly reduced. To restore gauge to operating condition, move lever of fill plug to the "open" position. If gauge is not mounted upright, move lever to the "closed" position after venting. Repeat procedure at regular intervals to maintain gauge accuracy.

ENSURE THERE IS ADEQUATE FUEL

Check the fuel tank to ensure there is adequate fuel to complete the job and transport the vehicle. This unit consumes approximately 1 US gallon of fuel per hour, depending on the speed setting.

REMOVE TOOLS FROM THE VEHICLE

Remove any tools, accessories or hoses from the vehicle that you will require.

WATER SUPPLY CONNECTION

NOTE: Prior to connecting your water inlet hose to any supply faucet, flush out the faucet until the water is free of any debris. Also, flush out any debris from your water inlet hose.

1. Connect the water supply hose to the water inlet quick connector on the water box. Connect the hose to the faucet.

NOTE: Never use a waste pump outlet hose as a water inlet hose. Use only clean hoses for water supply.

2. Turn the water supply faucet on. Water will fill the water box.

HIGH PRESSURE HOSE

Before starting the unit, connect the high pressure hose to the solution outlet connection at the front of the unit. Connect the cleaning tool to the opposite end of the pressure hose.

STARTING THE UNIT

△ CAUTION!

- 1. Set throttle control in.
- 2. Pull out engine choke.
- 3. Press and hold the OVERRIDE button while turning the ignition key to start the engine.
- 4. Push in engine choke after engine has started.
- 5. Let the engine warm up at 1/2 throttle.
- 6. Set throttle control to maximum.

Note: Do not operate the unit with throttle control set below 50% of maximum throttle setting.

NOTE: If the unit does not build water pressure after 5 seconds, check for adequate water supply. See "Loss of Water Pump Pressure in the **Troubleshooting** section of this manual.

VACUUM HOSE

Connect the vacuum hose(s) to the vacuum inlet connection at the front of the unit. Connect the opposite end of the vacuum hose(s) the cleaning tool. Let the unit run for a few minutes with the vacuum inlets partially blocked off to warm up the cleaning solution.

SAPPHIRE SCIENTIFIC recommends that the total floor tool size does not exceed #4. Using larger jet sizes on your **RAGE**[®] unit may reduce cleaning temperatures.

PRIMING THE CHEMICAL PUMP

NOTE: SAPPHIRE SCIENTIFIC recommends that the chemical pump be primed whenever the water pump is on. This eliminates possible pressure fluctuations and water pump pulsations related with running the chemical pump dry.

1. Insert the chemical prime tube and the chemical inlet tube into the chemical container.

NOTE: When inserting the chemical tube into the chemical container, ensure that it stays submerged, as the chemical pump will not function if air is allowed to enter the inlet line.

2. Turn the 3-way chemical selector valve located on the control panel to the **PRIME** position. The chemical will then flow from the chemical container through the chemical prime tube.

If the pump does not prime, then: Seal off the vacuum port. The vacuum will quickly draw chemical from the chemical container. After the flow begins, turn the chemical selector valve to **OFF** position and turn the chemical selector valve back to the **PRIME** position and continue the procedure.

3. When the chemical flows with no air bubbles, priming has been achieved. Turn the chemical selector valve from **PRIME** to **METER**. With the cleaning tool open, check the flow meter and adjust the chemical metering valve until the desired rate of chemical flow is achieved.

AUTOMATIC WASTE PUMP

- 1. If your unit is equipped with an optional automatic waste pump, connect one end of the 5/8 in. or larger garden hose to the pump-out connection and the other end to an acceptable waste disposal.
- 2. Turn the pump-out switch located on the front console control panel to the **ON** position. The waste pump will now operate automatically throughout the cleaning period.

DO NOT use an outlet hose that is smaller than $\frac{5}{8}$ in, I.D.

NEVER use a waste pump hose as a water inlet hose.

NEVER dispose of waste water in a storm drain, water way or on ground areas. Always dispose of waste in accordance with Local, State and Federal laws

OPERATION

When operating the unit for cleaning or restoration, the unit should be in the maximum throttle position. This ensures full vacuum and performance from the unit.

NOTE: During flood extraction the throttle control must be set to maximum.

CLEANING

While cleaning, observe the following guidelines:

- 1. Before cleaning, ensure that the wand nozzles are functioning properly.
 - A. Hold the wand approximately one foot above the surface to be cleaned and open the wand valve. A full even spray should emit from the cleaning nozzles.
 - B. If the nozzles are not showing a full even spray pattern, adjust, clean, or replace the nozzles, if required.
- 2. Usually, chemical solution is applied during the push stroke of the wand during cleaning, and extraction is done on the pull stroke. For heavily soiled carpets, the wand may be used in a scrubbing action, with chemical solution applied in both push and pull strokes, provided that the final stroke is a pull stroke with no chemical injection.

UPHOLSTERY CLEANING

1. Upholstery tools have a lower flow rate and smaller orifices. It may be necessary to slow the engine down and partially open the bypass valve to maintain proper cleaning.

FLOOD RESTORATION/EXTRACTION

This machine can be used for limited water extraction only if connected to an adequate water source and the bypass valve is opened 1/4 turn.

A CAUTION!

NEVER RUN THE PRESSURE PUMP DRY.

Doing so will quickly build up heat in the pump which may cause severe damage to internal components

An automatic waste pump-out is highly recommended when performing flood extraction to avoid shutdown from filling the waste tank.

- 1. Set the throttle control cable on the front control panel to maximum.
- 2. If an automatic waste pump-out is equipped, set the PUMP OUT switch to the ON position.
- 3. Proceed into the extraction process.

A CAUTION

To prevent excess heat build-up in the unit, do not restrict air flow to the wand head when not extracting water. If the wand must be placed down, position the head sideways or upside down.

NOTE: A float shut-off switch is located inside of the waste tank. It will automatically shut down the unit if the tank reaches its full capacity. If this occurs, empty the waste tank before continuing.

HEAT BYPASS OPERATION

The heat bypass has 2 purposes.

- 1. To cool down the unit at the end of the job when using for carpet cleaning. When finished with the job, open the heat bypass while coiling up the hoses to allow water to circulate through the unit and prevent excess heat buildup.
- 2. In flood extraction mode, open the valve 1/4 turn to keep water circulating through the pump to prevent pump overheating and premature failure.

SHUT DOWN AND DAILY MAINTENANCE

- 1. Flush out the chemical system with fresh water to remove any chemical residue.
- 2. Remove as much moisture from the vacuum hoses as possible. This will prevent spillage of wastewater in your vehicle when returning hoses.
- 3. Disconnect the vacuum hose from the front of the unit.
- 4. Adjust the throttle cable to the idle position.
- 5. Allow the unit to run at 50% throttle **for a few minutes**. This will also help to remove any excess moisture from the vacuum pump and cool the unit down.

NOTE: If shutting down for the day: Plug the vacuum inlet on the front of the unit and set the throttle control cable to high. Spray WD-40 (or equivalent) into the **blower lubrication cup**, located on the left hand side of the control panel for **5 seconds**. Let machine run 2 minutes to disperse lube to blower. Unplug the vacuum inlet and remove load. Next, return the throttle control cable to idle position, and let idle for 3 to 5 minutes.

6. Turn the ignition switch to the **OFF** position.

- 7. Turn the water supply faucet off. Loosen the water supply hose at the water supply to bleed off any pressure. Unhook the water supply hose and return it to the vehicle.
- 8. Activate the valves on all cleaning tools. This will relieve any remaining pressure. Disconnect the cleaning tools and solution hoses and return them to the vehicle.
- 9. Drain the waste tank, disposing of wastewater in a suitable and proper location.

⚠ WARNING!

NEVER dispose of wastewater in a storm drain, water way or on ground areas. Always dispose of waste in accordance with Local, State, and Federal laws.

10. Remove the strainer basket from the waste tank. Clean out any debris and re-install. Microban QGC cleaner is the best product for cleaning and sanitizing the waste tanks as well as other parts of the system

NOTE: Damage may occur to the vacuum pump.Replacement and maintenance of the filter will prevent rust and corrosion from entering the vacuum pump.

11. Inspect the vacuum inlet filter inside the waste tank **daily**. Remove and clean the filter if there is any lint or debris present.

NOTE: To remove the vacuum inlet filter, grip the plastic hexagon section of the filter. Gripping the filter by the screen will collapse or destroy the filter. After cleaning, grease the threads on the filter and replace the filter. Tighten the filter until hand tight and then loosen ½ turn. This will make the filter easier to remove when cleaning or replacement is required.

NEVER operate this unit with the filter removed, damaged or improperly installed.

- 12. At the end of the work day, rinse out the waste tank with fresh water. Microban QGC cleaner as the best product for cleaning and sanitizing the waste tanks as well as other parts of the system
- 13. Clean the vehicle interior, unit, tools, hoses etc., as needed. Inspect ALL equipment and accessories for any damage, leaks, wear, etc.

FREEZE PROTECTION

A CAUTION!

If the unit is exposed to freezing weather conditions, the water inside of the unit may freeze, resulting in SERIOUS DAMAGE to the unit. The following is recommended to prevent this from occurring during the cold weather season:

- 1. Always park the unit in a heated building when not in use.
- 2. While out in operation, avoid long periods of shut down as the unit generates heat while running.
- 3. If a heated building is not available, winterize the unit with anti-freeze.

It is not possible to winterize units that have auxiliary water tanks. If the unit has an auxiliary water tank(s), it must be stored in a heated building.

WINTERIZING YOUR UNIT WITH ANTI-FREEZE:

- 1. Shut off the water supply to the unit and disconnect the water inlet hose from the water box.
- 2. Connect all solution hoses and a tool to the console.
- 3. Start the unit.
- 4. Fill the water box with one gallon of 100% glycol based anti-freeze.

SECTION 3

- 5. Start the unit and set the throttle control cable to the idle position. Insure the water pump is on. Open a tool valve until anti-freeze comes out of the tool. Repeat this procedure with ALL remaining tools and hoses.
- 6. After the tools and solution hoses have been filled with anti-freeze, disconnect and store them.

Recover all anti-freeze that comes out of the tools and hoses and store in an approved container. ALWAYS re-use or re-cycle antifreeze.

7. Prime the chemical injection system with a 100% glycol based antifreeze. Insert the chemical inlet and prime tube into the anti-freeze container. Turn the chemical valve to PRIME until anti-freeze comes out of the prime hose. Turn the chemical valve to the **ON** (chemical) position. Ensure that the flow meter indicates flow while the attached tools solution valves are opened. Ensure that all anti-freeze that comes out of the chemical hose goes into an approved container.

After 25 seconds, turn the chemical valve to the **OFF** position.

8. Allow the unit to run for at least **3 minutes**. The unit is now winterized.

REMOVING ANTI-FREEZE FROM THE **UNIT:**

- 1. Connect the solution hoses to the unit, with a tool attached to the opposite end. Start the unit. Turn the water pump on. Open the tool valve and ensure that the anti-freeze goes into an approved container. Allow the anti-freeze to flow into the container until all anti-freeze has been drained.
- 2. Fill the water box with fresh water and repeat step 1.
- 3. Connect the water inlet hose to the unit and turn the water supply on. Connect all tools and solution hoses that were winterized to the solution outlet connection.

REMOVING ANTI-FREEZE FROM THE UNIT CONTINUED:

Open all tool valves and drain the anti-freeze into an approved container until the water runs clear and all of the anti-freeze is purged from the hoses and tools.

- 4. Insert the chemical prime hose into the approved container. Submerge the chemical hose into fresh water. Turn the chemical valve to the **PRIME** position until the water runs clear through the prime hose. Remove the prime hose from the container.
- 5. Turn the chemical valve to the **ON** (chemical) position and open attached tools solution valves. This will allow water to flow to the other side of the system.

After all of the anti-freeze has been removed, the unit is ready to operate.

The anti-freeze in your approved storage container will eventually become diluted with water. When the anti-freeze level drops below 70% of the total mixture, properly dispose of it and start over with fresh 100% anti-freeze.

DO NOT drain used anti-freeze on the ground or into storm drains.

Dispose of anti-freeze only in an approved location. Observe Local, State and Federal laws when disposing of anti-freeze.

Engine 1000 Hours Kepiace air filter element.	Engine	1000 Hours	Replace air filter element.	

To maximize the operating life and performance, use only recommended oils, filters and greases.

^{*}Or as often as required.

^{**}Change engine oil and oil filter after **first 50 hours** of operation.

^{***}Change water pump crankcase oil after **first 50 hours** of operation

^{****}Inspect after first week of operation, and remove any debris present. Inspect again after 2 to 4 weeks.

^{*****}Check pulley and hub set screws after **first 50 hours** of operation, and again at **100 hours** of operation.

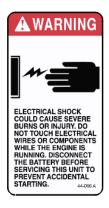

^{******}Or every 6 Months. Whichever comes first.

^{******}Or Yearly. Whichever comes first.

^{******}Re-tension all belts after first 25 hours then at every 100 hours of operation.

7. MAINTENANCE

This section of the operator's manual contains the service and maintenance information for the **RAGE**[®] unit. A planned preventative maintenance program will ensure that your **SAPPHIRE SCIENTIFIC RAGE**[®] has optimum performance, long operating life, and a minimum amount of down time.

△ WARNING!

DO NOT attempt to service this unit while it is running. High speed parts as well as high temperature components may result in severe injury, severed limbs, or fatality.

NOTE: Refer to the hour meter as a guide for coordinating a maintenance schedule.

ENGINE

- 1. Check the engine oil level daily. Ensure that the proper oil level is maintained. **NEVER** overfill.
- 2. Change the oil after the first **5 to 8 hours** of operation. Thereafter, change oil and oil filter every **50 to 100 hours** of operation. USE ONLY KOHLER OIL FILTERS. USE OF ANY OTHER TYPE OF OIL FILTER WILL VOID ENGINE WARRANTY.

Use high-quality oil of at least API (American Petroleum Institute) service class SJ or higher. **Do not use additives.** High quality 30W oil is recommended. A 10-30 synthetic blend may be used after 50 hours of operation for a new or rebuilt engine to allow the piston rings to properly seat. It is never recommended to extend oil change intervals past 100 hours.

Engine oil capacity 1.8	8 U.S.qts
-------------------------	-----------

Tightening torque	Drain Plug	13.6 N·m 1.4 kgf·m 10.0 lbf·ft
-------------------	------------	--------------------------------------

NOTE: Using a lower service class oil or extending oil change intervals longer than recommended can cause engine damage.

NOTE: Synthetic oils meeting the listed classifications may be used with oil changes performed at recommended intervals. However to allow piston rings to properly seat, a new or rebuilt engine should be operated for at least 50 hours using standard petroleum based oil before switching to synthetic oil.

- 3. Check the spark plugs every **200 hours** and clean if necessary. Replace spark plugs every **1000 hours. NEVER** sandblast spark plugs. Spark plugs should be cleaned only by scraping or wire brushing.
- 4. Clean the engine air filter element every **200 hours.** Replace the element every **1000 hours.**

Replace the in-line fuel filter **yearly. NOTE:** Additional engine service information can be obtained from the provided Operation and Maintenance manual. If service or repair is required, contact an authorized Kohler Service Center. They will require the serial number of the engine.

VACUUM PUMP

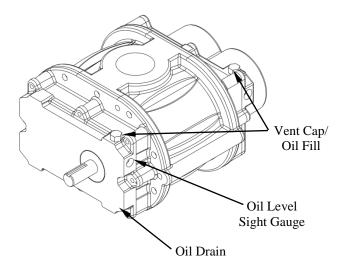

NOTE: Refer to the provided Vacuum Pump Operation and Service Manual for specific instructions.

Lubrication: SAPPHIRE SCIENTIFIC

recommends that you use only ISO 100 Synthetic Blower Lubricant in the vacuum pump for all operating temperatures. ISO 100 oil is formulated to provide maximum blower protection at any temperature. One filling of ISO 100 oil will last a minimum of twice as long as a premium mineral oil.

NOTE: ISO 100 Oil (Part # 13-039) is the only oil that **SAPPHIRE SCIENTIFIC** puts in the vacuum pump at the factory. Adding petroleum oil to synthetic oil is **NOT** recommended.

1. Check the oil level **daily** to ensure it is at the proper level. Too little oil will damage and ruin the bearings and gears. Too much oil will result in overheating.

2. A lubrication cup has been provided at the front of the console, to prevent rust from building up inside of the vacuum pump.

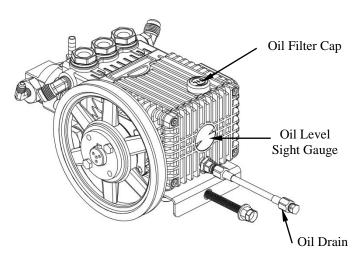

Run the unit for at least **2 minutes** to remove any moisture from the vacuum pump. Then, spray WD-40 (or Equivalent) into the lubrication cup for **5 seconds** while the unit is running and the vacuum inlet port is sealed. This procedure should be done at the end of **every working day**.

3. Drain, flush and replace the oil every **1000** hours or 1 year, whichever comes first.

WATER PUMP

Refer to the provided Water Pump Operation Manual for specific instructions.

1. Check the crankcase oil level **daily** to ensure the proper level. If the level has dropped, check for the source of leakage and repair.

2. After the first **50 hours** of operation, change the crankcase oil with general pump oil. Change the crankcase oil every **500 hours** thereafter.

Vacuum Pump:

Belt Replacement Procedures for The RAGE:

- 1) Disconnect the negative battery cable
- 2) Remove hose from waste tank to vacuum pump
- 3) Remove hoods
- 4) Remove top panel (6 screws)
- 5) Remove left and right hand belt guards
- 6) Loosen all 4 blower mounting nuts
- 7) Loosen clamps on silencer hose
- 8) Slide the blower back (away from engine)
- 9) Lower front 2 nuts located under the front of blower mounting plate approximately ½"
- 10) Tip the back of blower up
- 11) Remove all belts. Install new belts
- 12) Reverse procedures to install new belts
- 13) After belts have been installed, check for proper tension and alignment. Do this using a belt gauge. Set deflection to 1/8"; 10-12 lbs tension
- 14) Check pulleys for alignment using a straight edge (example: ½" key stock). Make sure pulley flange touches on 2 places on each pulley (4 total places)
- 15) Estimated time, 2 hours

VACUUM INLET FILTER

1. The vacuum inlet filter in the waste tank should be inspected and cleaned daily.

CAUTION!

When removing the vacuum inlet filter, grip the plastic hexagon section of the filter. Grasping filter by the screen will damage or destroy the filter. Applying grease to the threads will allow easier removal of filter when cleaning or replacement is required.

DRIVE BELT AND PULLEYS

A CAUTION!

Ensure that when you re-torque the screws, you use a clockwise pattern and continue until the proper torque is achieved.

TORQUE VALUES			
Component	Inch/lbs	Foot/lbs	
Engine Rear Hub	160	13.3	
Engine Front Hub	160	13.3	
Vacuum Pump Hub	160	13.3	
Pressure Pump Hub	130	10.8	

WASTE TANK STRAINER BASKET

The strainer basket located in the waste tank should be emptied and cleaned on a daily basis. Microban OGC cleaner is the recommended product for cleaning and sanitizing the waste tanks as well as other parts of the system.

CHECK VALVE STRAINER (OUTLET)

Unscrew the screen and inspect the strainer after the first week of operation. Remove any debris present. Inspect again after 2 and 4 weeks. Thereafter, inspect the strainer and screen at least monthly. If a frequent build-up of debris is noticed, inspect and clean more frequently.

CHEMICAL PUMP

The chemical pump should be rebuilt every **500** hours. This involves changing the diaphragm, check valves, and inspecting the disk.

CHEMICAL METERING SYSTEM

Check and inspect the packing nut on the chemical selector and metering valves every **200 hours.** Keeping the valve packings properly adjusted will prevent leaks and add to the overall life of the valves.

PRESSURE REGULATOR

Lubricate the o-rings in the pressure regulator every **100 hours.** Use only o-ring lubricant (Part #13-003).

VACUUM HOSES

To ensure maximum hose life, **SAPPHIRE SCIENTIFIC** recommends that you wash out the hoses with fresh water **daily**. Microban QGC cleaner as the best product for cleaning and sanitizing the wands and hoses as well as other parts of the system

BATTERY

△WARNING!

Explosive gases, Dangerous acid!

Batteries contain sulfuric acid. To prevent acid burns, avoid contact with skin, eyes and clothing. Batteries also produce explosive hydrogen gases while charging. To prevent fire or explosion, charge batteries only in a well ventilated area. Keep sparks, open flames, as well as any other sources of ignition away from batteries at all times. Remove all jewelry prior to servicing batteries. Keep batteries out of the reach of children.

Before disconnecting the negative (-) ground cable, ensure that all switches are in the OFF position. If ON, a spark could occur at the ground connection terminal which could cause an explosion if hydrogen gas or gasoline vapors are present. ALWAYS disconnect the negative (-) terminal first.

- 1. If you do not have a maintenance free sealed battery, check the fluid level in the battery at least **once a week.** If low, fill to the recommended level **ONLY** with distilled water. **DO NOT** overfill the battery. Early failure or poor performance will result due to loss of electrolyte.
- 2. Keep cables, terminals and external surfaces of the battery clean and dry. A buildup of corrosive acid or grime on the external surfaces could cause the battery to self-discharge.
- 3. Battery terminals should be cleaned every **100 hours** to prevent corrosion buildup. Wash the cables, terminals and external surfaces with a mild baking soda and water solution. Rinse thoroughly with fresh water. **DO NOT** allow baking soda to enter the battery cells, as this will destroy the electrolyte, resulting in battery failure

HIGH PRESSURE SOLUTION HOSES

Inspect your high-pressure solution hoses for wear after the first **100 hours.** Thereafter, inspect every **25 hours.** If the hoses show any signs of damage or impending rupture, replace the hoses.

NEVER attempt to repair high-pressure solution hoses. Repairing high-pressure solution hoses may result in severe burns and serious injury.

All high-pressure solution hoses must be rated for 3000 PSI at 250 deg. F. Thermoplastic hoses do not meet this requirement and should not be used. Severe burns and injury may result if the hoses do not meet these requirements.

8. GENERAL SERVICE ADJUSTMENTS

△WARNING!

DO NOT attempt to service this unit while it is running. High speed parts as well as high temperature components may result in severe injury, severed limbs, or fatality.

ENGINE SPEED

1. To adjust the engine RPM, refer to the Engine Operation and Service Manual for specific instructions.

DO NOT attempt to adjust without a tachometer and NEVER adjust the engine above 3200 RPM.

VACUUM RELIEF VALVE

With the unit running at full RPM, block off the airflow at the vacuum inlet port and read the vacuum gauge. If adjustment is required, shut the unit down and adjust the locking nut tension on the vacuum relief valve. Re-start the unit and read the vacuum gauge. Repeat this process until the vacuum relief valve opens at 13" Hg. Always ensure the lock nut is retightened.

WATER PUMP DRIVE BELT

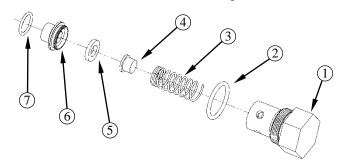

To tighten the water pump belt:

- 1. Loosen the four nuts, which hold the water pump base to the frame.
- 2. Adjust the position of the belt tensioning.
- 3. While checking the alignment, tighten the nuts that hold the water pump to the base.

SOLUTION OUTLET CHECK VALVE

Inspect the check valve whenever performing service on the chemical pump or if flow problems are occurring in the chemical system.

- 1. Remove the check valve, ensuring that the small o-ring on the seat comes out with it
- 2. Next, remove the seat using a 5/16 in. Allen wrench
- 3. Check the Teflon seat for wear or debris. Clean and replace the seat if necessary.
- 4. Inspect the poppet and the spring for wear or damage. Clean and replace as necessary.
- 5. Re-assemble the check valve. Thread the seat by hand until snug. Then tighten with a 5/16 in Allen wrench. **DO NOT** over-tighten.

23-063 VLV, CHECK, CHECK VLV MANIFOLD

Item#	Part Number	Qty.	Description
1	27-009	1	CAP, CHECK VALVE ASSY. SS
2	41-007	1	ORING, 7/8 ID X 1-1/16 OD
3	15-007	1	SPRING, CHECK VALVE ASSY.
4	27-010	1	POPPET, CHECK VALVE ASSY
5	27-004	1	INSERT, SEAT-CHK VLV ASSY TM
6	27-011	1	SEAT, CHECK VALVE ASSY.
7	41-008	1	ORING, ½ ID 5/8 OD

Note: Improper seating of the check valve seat, poppet, damaged spring or o-rings will result in poor performance of the chemical system.

6. Lubricate the o-rings with o-ring lubricant. (Part # 13-003) and re-install.

CHEMICAL PUMP

The **RAGE**[®] unit features a stainless steel chemical pump and metering system. The chemical pump requires only the replacement of the diaphragm and check valves. To replace the diaphragm, unscrew the cover from the body. When replacing the diaphragm, lube the outer edges of the diaphragm with o-ring lubricant (Part #13-003) and reassemble.

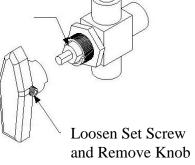

To replace the check valves, remove the check valve caps, replace the check valves and reassemble using new o-rings. **DO NOT** attempt to reuse o-rings after the check valves have been removed.

PACKING NUT ADJUSTMENT CHEMICAL METERING/SELECTOR VALVES

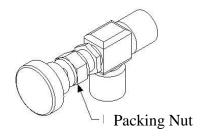

Inspect the packing nut for proper tension on the chemical metering and chemical selector valves every **200 hours.** When turning the knob, there should be some resistance. If not, slightly tighten the packing nut. **DO NOT** over-tighten. Keeping the packing properly adjusted will eliminate possible leaks and will add to the overall life of the valves.

Chemical Prime Valve

Adjust the packing nut by turning the packing bolt clockwise at 1/16" increments.

Chemical Metering Valve

PRESSURE REGULATOR

The pressure regulator holds water pressure at a preset point and bypasses the excess water back to the water box.

To adjust:

- 1. With the unit running, close the cleaning tool valve. Check the pressure gauge. Open the tool valve. Set the pressure regulator so that the pressure gauge reads 450 PSI with the tool valve closed. With the tool valve open, there should be a normal drop in pressure. If the drop is greater than 100 PSI, it may be necessary to lubricate the pressure regulator o-rings.
- 2. To adjust the pressure regulator, turn the adjusting knob (while observing the pressure gauge on the control panel) until you reach the desired pressure.

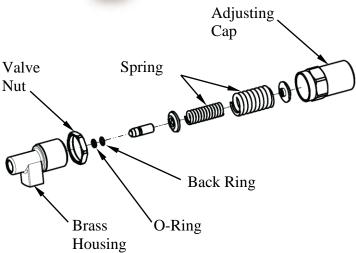

DO NOT loosen the adjusting body (cap) all the way (counterclockwise) or remove it while the unit is running.

We recommend that you lubricate the pressure regulator o-ring every **100 hours**, or whenever required. If you do not, the stem may become seized due to inadequate lubrication. If this occurs:

- a) Shutdown the unit.
- b) Relieve all pressure from the water system.
- c) Remove the cap from the pressure regulator and remove the stem with long nose pliers.
- d) Clean and lubricate stem.
- e) Reassemble pressure regulator

9. TROUBLESHOOTING

DO NOT attempt to service this unit while it is running. High-speed parts as well as high temperature components may result in severe injury, severed limbs or fatality.

This section of the operator's manual describes how to look for and repair malfunctions, which may occur.

Accurate troubleshooting is based on a thorough and complete understanding of the WATER, CHEMICAL, VACCUM, HEAT TRANSFER, SAFETY and WIRING systems featured in this unit.

If there are malfunctions occurring on this unit which you do not understand, refer back to the **OPERATION** section of this manual and review **SYSTEM**

TROUBLESHOOTING: ENGINE

PROBLEM	CAUSE	SOLUTION
	Main circuit breaker on the control panel has been tripped.	After inspecting the unit to determine the cause of the tripped circuit breaker, press the reset button.
	Loose or corroded battery.	Clean, tighten, or replace the battery terminals.
	Dead battery.	Recharge or replace battery.
Engine will not start: The engine does not turn over	Defective ignition switch.	Test ignition switch for power going into the switch. If there is power going in but NO power going out, replace the switch.
	Defective starter motor.	Test the starter motor. If necessary replace.
	Vacuum pump seized.	Refer to Tuthill Service and Repair Manual.
	Waste tank is full.	Empty the waste tank.
	Defective fuel pump.	Replace the fuel pump.
	Loose or broken wires leading to waste tank float switch.	Repair or replace any broken electrical connections.
Starter turns over engine, but	Defective float switch in the waste tank.	Check switch for proper operation, replace as necessary.
will not start	Oil pressure switch (located on engine), fuel shut-off solenoid (located on engine).	Test these components. If any are defective, replace. Consult Operation and Maintenance Manual.
	Engine is malfunctioning	Refer to Engine Operation and Maintenance Manual.
Excessive heating	Flow restriction caused by hard water scaling.	De-scale unit, repair or replace damaged plumbing components as necessary. Install water softener.
	Not enough water flow.	Check jet size of tool.

TROUBLESHOOTING: ENGINE

PROBLEM	CAUSE	SOLUTION
	Engine is out of gasoline	Add gasoline to the fuel tank.
	Waste tank is full	Empty waste tank.
	Main circuit breaker on the control panel has been tripped.	After inspecting the unit to determine the cause of the tripped circuit breaker, press the reset button.
	Defective fuel pump.	Replace fuel pump.
Engine stops running: While doing normal cleaning, the engine stops running	Defective float switch inside the waste tank.	Check switch for proper operation. Replace as necessary.
engine stops running	Oil pressure switch on engine has shut down, due to insufficient oil pressure.	Refer to the Engine Operation and Maintenance Manual. DO NOT restart the engine until the cause is determined and corrected.
	No ignition in the engine or engine is malfunctioning.	Refer to the Engine Operation and Maintenance Manual.
Heat exchanger leaks NOTE: The heat exchanger will produce water condensation discharge at times during normal operation. DO NOT confuse this with a leak. Engine/vacuum exhaust heat exchanger is damaged from frozen water.		Inspect heat exchanger for leaks. Visually inspect for damage. Pressure check after removing from the unit. (Maximum test pressure 1000 PSI).
	Solenoid switch stuck open	Replace temperature switch
Loss of temperature: The heat	Engine RPM is low.	Reset engine RPM.
output of the unit is LESS than normal.	Defective temperature gauge.	Test gauge and sensor. Replace failed component.
	Defective waste pump float switch.	Replace float switch.
	Broken diaphragm(s).	Replace diaphragm(s).
Automatic waste pump is malfunctioning or not	Weak battery.	Charge or replace battery if needed. Check charging station.
operating normally.	Pump-out circuit breaker on control panel has been tripped.	After inspecting waste pump to determine the cause of the tripped circuit breaker, press the reset button.
	Inspect check valve for debris or damage.	Clean or replace if necessary.

TROUBLESHOOTING: BLOWER / VACUUM PUMP

PROBLEM	CAUSE	SOLUTION
Evaccivo Vacuum	Improper throttle adjustment.	Adjust throttle to set desired vacuum pressure.
Excessive Vacuum	Vacuum relief valve requires adjustment.	Readjust the vacuum relief valve to 13"Hg

TROUBLESHOOTING: BLOWER / VACUUM PUMP

PROBLEM	CAUSE	SOLUTION
	Vacuum gauge is giving an improper reading.	Examine the tubing between the vacuum relief valve and the vacuum gauge and remove any blockage.
	Vacuum hose(s) is damaged, causing a suction leak.	Inspect hose(s), repair or replace.
	Waste tank gaskets not sealing properly, not positioned properly	Inspect the gasket. Repair seal or replace Re-position lid(s).
Loss of vacuum: While	Plugged vacuum hose or vacuum plumbing between vacuum inlet and strainer basket.	Unplug vacuum hose or inlet plumbing.
cleaning, the vacuum is not up to specification. Engine RPM is normal.	Waste tank filter or strainer basket is plugged.	Clean or replace filter. Clean strainer basket.
norman.	Loose vacuum pump drive belts.	Tighten the drive belts
	Waste tank drain valve is damaged or left open, causing a vacuum leak.	Drain the waste tank. Close drain valve, if open. Remove the dump valve and, after inspecting, replace the defective components.
	Vacuum relief valve requires adjustment or has a vacuum leak due to damaged diaphragm.	Re-adjust the vacuum relief valve. If the vacuum does not increase, remove and inspect the relief valve diaphragm. If damaged, replace
	Vacuum pump is worn out.	Replace the vacuum pump.

TROUBLESHOOTING: WATER PUMP

PROBLEM	CAUSE	SOLUTION
	Plugged orifice and/or screen in the cleaning tool.	Unplug or replace orifice and/or screen
Loss of solution volume at cleaning tool orifice: Solution pressure gauge reads normal.	Internal block between the pressure regulator manifold and the outlet manifold, or the solution screen is clogged	Inspect all lines, remove accumulated debris which is blocking proper flow. Replace any defective hoses. Remove, inspect, and clean the solution screen. De-scale unit and install a water softener, if necessary.
	Outlet check valve is plugged	Examine the check valve, remove any debris
	Cleaning tool valve is malfunctioning.	Repair or replace valve.

TROUBLESHOOTING: WATER PUMP

PROBLEM	CAUSE	SOLUTION
	Hose inner lining is constricted.	Remove restriction or replace hose.
Loss of solution volume at cleaning tool orifice: Solution pressure gauge reads normal.	Air leak in chemical supply line, priming valve or metering valve.	Check for air leaks. Replace faulty parts.
	Defective quick-connect on one or more of the high pressure hoses.	Replace defective quick-connects(s) on high pressure hoses(s).
	Water supply is turned off or the float valve is stuck.	Turn the water supply on or up. Check for kinks in the water supply hose. Examine the float or replace.
	Solution pump inlet supply line is plugged or drawing air.	Examine the water inlet filter inside the water box. Remove accumulated debris and replace if required. Check for suction leaks and loose clamps or fittings. Tighten any loose fittings or clamps. Replace any ruptured hose(s).
	Improper engine speed	Using a tachometer, check the engine speed. Full throttle engine speed is 3000 RPM. Idle engine speed is 1500 RPM. Refer to the "engine speed" section for instructions on how to readjust.
	Pressure regulator o-rings are dry.	Lubricate o-rings, using o-ring lubricant
Loss of solution pump pressure: With the cleaning	Pressure regulator has worn orings	Check o-rings. If necessary, replace.
tool open, the solution pressure gauge reads below the normal operating pressure.	Pressure regulator is dirty, stuck open, or improperly adjusted.	Clean or repair regulator. Adjust to working pressure. Lubricate o-rings, using o-ring lubricant Part
	Low pump volume. (Measure the amount of water being returned to the water box from the pressure regulator. It should fill a gallon container about every 17.6 seconds).	Examine the check valves, plunger cups, and cylinder head on the water pump. Repair, whenever required (refer to the water pump service manual).
	Defective water pressure gauge.	Replace gauge
	Orifice (spray nozzle) in the cleaning tool is worn, defective, or wrong size.	Replace Nozzle or change nozzle size.
	Debris clogging water lines or water inlet disconnect.	Clean or replace as needed.
	Belts loose or broken	Re-tension or replace as needed.
		1

TROUBLESHOOTING: CHEMICAL SYSTEM

PROBLEM	CAUSE	SOLUTION
	External leak in chemical piping	Tighten fittings. Re-apply thread sealant where required. If any fittings are damaged, replace.
	Outlet check valve is full of debris or damaged, not allowing it to close properly	Close the chemical valve on the instrument panel. If the flow meter does not indicate flow, remove debris or replace check valve, if necessary.
Chemical flow meter indicates flow with the tool valve closed	Chemical pump diaphragm is ruptured	Close the chemical valve on the instrument panel. If the flow meter still indicates flow, replace the chemical pump diaphragm.
	Internal leak in chemical valve causing continual flow through prime tube returning to container.	Tighten valve packing nut (see "General Service Adjustments" section in this manual). Replace valve, if necessary.
	Chemical pump is improperly primed.	Refer to chemical pump priming instructions.
Loss of chemical: With the cleaning tool valve open, no chemical	The strainer at the inlet end of the chemical inlet line is clogged	Unclog the strainer. If damaged, replace.
chemical	Suction leak in the inlet line leading into the chemical pump.	Inspect inlet lines and flow meter for air leaks or damage and replace, if required.
	Chemical pump check valve(s) is clogged	Remove any debris from the chemical check valve(s). Replace chemical check valve(s) or seals, if necessary.
Loss of chemical: With the	Chemical prime/on-off valve or chemical metering valve is defective.	Replace valve(s).
cleaning tool valve open, no chemical	Chemical pump diaphragm is ruptured.	Disassemble the chemical pump and replace the damaged diaphragm.
	Defective cylinder in the water pump.	Measure the pump volume. If the pump volume is less than normal, refer to "Loss of Pump Volume" in the Troubleshooting section in this manual.

SECTION 5 Fuel Line Bulkhead Installation (Inside Vehicle)

- 1. Select an appropriate location on the vehicle floor away from operator or maintenance traffic and away from contact with any accessories or tools while in use or transit. Make sure your hole is within adequate reach of the supplied hose in the finished assembly.
- 2. Drill a 3/4 inch hole through the vehicle floor at the location chosen for the bulkhead connector.
- 3. Install the bulkhead connector by inserting the fitting and tightening the nut and lock washer on the opposite side of the vehicle floor.
- 4. Inside the vehicle, attach the hose barb fitting and connect the fuel line from the console.
- 5. Drill a 1/2 inch hole nearby the bulkhead fitting for the fuel pump electrical extension harness to pass through.

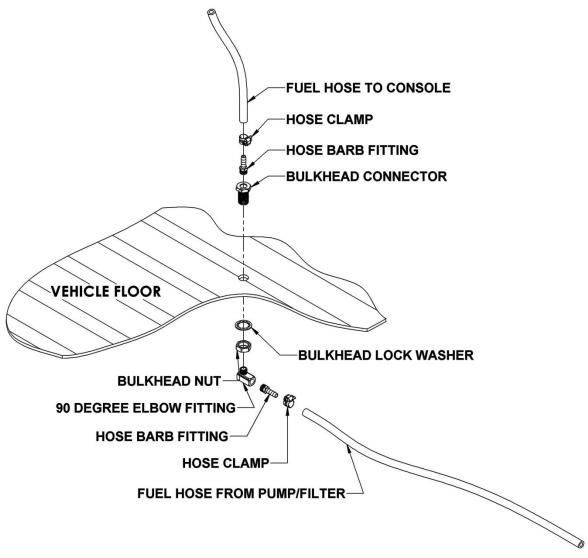

Figure 1. Fuel Line Bulkhead Assembly

Fuel Pump Assembly Installation (Underneath the Vehicle Floor)

- 1. Locate an appropriate location for the fuel pump assembly housing to mount underneath the vehicle that will not cause damage to the vehicle or compromise the fuel line routing or components.
- 2. Remove the housing lid from the fuel pump assembly.
- 3. Use the supplied Tek screws to install the lid of the fuel pump housing to the vehicle.

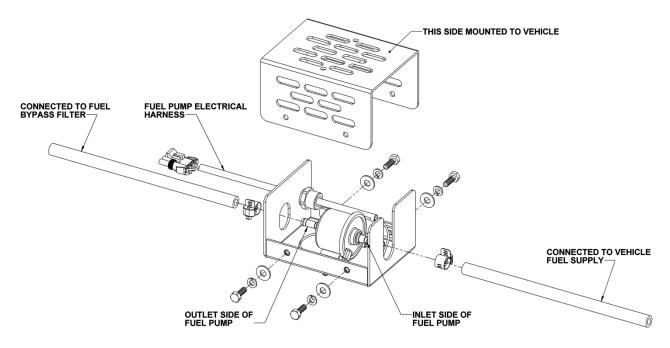

Figure 2. Fuel Pump Assembly Detail

Fuel Supply & Return Line Installation (Underneath the Vehicle Floor)

- 1. Refer to the transfer flow kit instructions found with the appropriate kit for your vehicle.
- 2. Connect the fuel line from the transfer flow kit to the inlet side of the fuel pump.
- 3. Connect the outlet side of the fuel pump to the inlet side of the fuel bypass filter.
- 4. Connect the return line from the bypass filter return port back to the vehicle fuel supply.

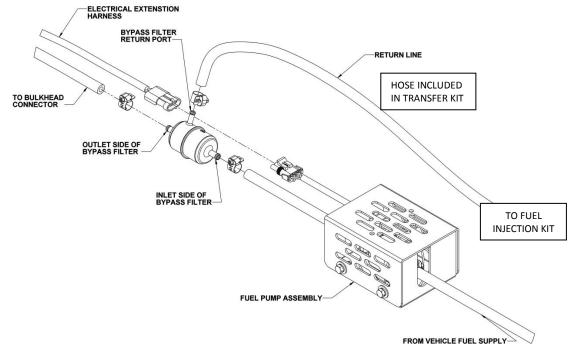

Figure 3. Fuel Pump and Filter Detail

- 5. Attach the 90 degree elbow and hose barb fittings to the bulkhead connector underneath the vehicle.
- 6. Connect a segment of hose between the outlet side of the fuel bypass filter to the hose barb fitting.
- 7. Ensure that all hose clamps are properly tightened.
- 8. Connect the electrical extension harness to the fuel pump harness, running the other end up through a hole in the floor of the vehicle, connecting to the console harness.
